

W5 Project Progress Update

Report Date: 08th March 2026

Project Title: Personal Budget Tracker

Course: OOP (Java)

Team members: Yan Sovanpisoth, Kong Sothearith, Kov Cheaching, Siv Kimleng

1. Implementation of Inheritance Structure to Record class

1.1. Description of the Change

During this week, our team improved the class structure of the project by implementing inheritance. The Record class was refactored into an abstract class to serve as a general representation of financial records. Two specific subclasses, Income and Expense, were created to extend the Record class. These subclasses inherit common attributes and behaviors from Record while allowing specialized functionality for different types of financial transactions.

1.2. Reason for the Change

This modification was implemented to improve the object-oriented design of the system. By using inheritance and abstraction, the code becomes more structured, reusable, and easier to maintain. It also allows shared properties (such as date, amount, or description) to be defined once in the parent class while enabling the subclasses to represent different types of records.

1.3. Responsible Team Member

- Yan Sovanpisoth & Kov Cheaching were responsible for the concept of where to apply Inheritance and what classes to add and change.
- Kong Sothearith & Siv Kimleng were responsible for actual adding the Inheritance concept to the code.

2. Overall Progress Summary

This week's progress focused on improving the project's object-oriented architecture. We made a little progress for this week's update because we need to focus on understanding more about the concept of inheritance than applying it.
